Cell Cycle regulatory protein HPC2 - yeast (Saccharomyces cerevisiae)
NyAlternate names: protein YBR1503; protein YBR215w
C;Species: Saccharomyces cerevisiae
C;Species: Saccharomyces cerevisiae
C;Date: 07-May-1993 #sequence revision 03-May-1994 #text_change 29-Oct-1999
C;Accession: A48123; S46091; $46089; S27426
R;Xu, H.; Kim, U.J.; Schuster, T.; Grunstein, M.
Mol. Cell. Biol. 12, 5249-5259, 1992
A;Title: Identification of a new set of cell cycle-regulatory genes that regulate S-phas A;Reference number: A48123; MUID:93024471; PMID:1406694
                    C;Superfamily: SH3 homology F;240/Product: signal transducing adaptor molecule #status predicted <MAT> F;2-240/Promain: SH3 homology <SH3> F;217-264/Domain: SH3 homology <SH3> F;359-387/Region: immunoreceptor tyrosine-based activation motif
                                                                                                                                                                                                                                                                                                                                                                                488 AlaAlaAlaAlaAlaVal 495

Not required for the specification of neuronal identity. May regulate transcription by binding to DNA (By similarity).
-!- SUMCELBULATION: Nuclear (By similarity).
-!- SIMILARITY: Belongs to the Prospero homeobox family.
                                                                                                                                                                                                                                                                                                                    MEDLINE=20503846; PubMed=11051550; Xu C., Kauffmann R.C., Zhang J., Kladny S., Carthew R.W.; Woverlapping activators and repressors delimit transcriptional response to receptor tyrosine kinase signals in the Drosophila eye."; Cell 103:87-97(2000).

Used to improve some of the physical properties such as firmness, elasticity and moisture retention of food such as meat, poultry and seafcod. SIMILARITY: Belongs to the bacterial IGase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   conjugation of polyamines to proteins.
-!- CARTALYTIC ACTIVITY: Protein glutamine + alkylamine = protein N(5) - alkylglutamine + NH(3).
-!- MASS SPECTROMETRY: WW=37869.2; MW_ERR=8.8; METHOD=Electrospray;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   It has

"P-domains as shuffled cysteine-rich modules in integumentary mucin c.1 from Xenopus laevis. Polydispersity and genetic polymorphism.";

J. Biol. Chem. 267:24620-24624 (1992).

-!- FUNCTION: Could be involved in defense against microbial infections. Protects the epithelia from external environment.

-!- SUBCELDULAR LOCATION: Secreted.
-!- ALTERNATIVE PRODUCTS:

Lee B.N., Adams T.H.;

"Overexpression of flbA, an early regulator of Aspergillus asexual

sporulation, leads to activation of brlA and premature initiation of

development.";

    development.";
    Mol. Microbiol.
    14:323-334(1994).
    1- FUNCTION: Required for asexual sporulation and normal colony development. May be involved in briA activation. Could play a regulatory role in controlling the flug-initiated signal transduction pathway that triggers the asexual reproduction.
    1- DEVELOPMENTAL STAGE: Present throughout the asexual cycle.
    1- SIMILARITY: Contains 1 RGS domain.
    1- SIMILARITY: Contains 1 DEP domain.

                                                                                                                                                                                                                                                                                                                                                 Emericella nidulans (Aspergillus nidulans).

The coordinate Opaque-2-controlled synthesis of this protein and the major seed storage proteins (zeins) may provide the agerminating seedling with both nutritional benefits and protection against pathogen invasion of the surrounding endosperm. CATANTIC ASTIVITY: Endohydrollysis of the N-glycosidic bond at one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  TISSUE SPECIFICITY: Actumulates to high levels in seeds. SIMILARITY: Belongs to the ribosome-inactivating protein family. Type 1 RIP subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Zea mays (Maize).

Note=No experimental confirmation available;
Note=No experimental confirmation available;
DOMAIN: Although the SET domain contains the active site of enzymatic activity, both sequences upsetream and downstream of the SET domain are required for methyltransferase activity.
SIMILARITY: BELOGS TO THE HISTONE-LYSINE METHYLTRANSFERASE FAMILY. PR/SET SUBPRAILY.
SIMILARITY: Contains 1 SET domain.
CAUTION: It is uncertain whether Met-1 or Met-72 is the initiator.

                                                                                                                                                                          human and mouse cDNA sequences.";

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

-!- SUBCELLULAR LOCATION: Nuclear (By similarity).

-!- TISSUE SPECIFICITY: Expressed predominantly in the stomach, trachea, bladder and salivary gland.

-!- SIMILARITY: Contains 1 fork-head domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Eukaryota; Metazoa; Arthropoda; Hexapoda; Insecta; Pterygota; Neoptera; Endopterygota; Diptera; Brachycera; Muscomorpha; Ephydroidea; Drosophilidae; Drosophila.

"The HBP-1 family of wheat basic/leucine zipper proteins interacts
with overlapping cis-acting hexamer motifs of plant histone genes.";
J. Biol. Chem. 269:9974-9985(1994).
-!- FUNCTION: Binds to the hexamer motif 5'-ACGTCA-3' of histone gene
promoters. Also binds to the hexamer motif in the promoter of the
35S RNA of Cauliflower mosaic virus.
-!- SUBUNIT: Binds DNA as a dimer.
-!- SUBURITY: Belongs to the bZIP family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SEQUENCE FROM N.A.

STRAIN-Kinshu X Showa; TISSUB-Fat body;

Ramimura M., Tomita S., Fujiwara H.;

Submitted (AUG-1995) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Receptor for ecdysone. Binds to ecdysone response elements (BCRES). May play a role in the implementation of the choriogenic program at the end of vitellogenesis.

-!- SUBNINIT: Heterodimer of ECR and CF1 (Potential).

-!- SUBCELLULAR LOCATION: Nuclear.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           01-OCT-1996 (Rel. 34, Created)

Rieger M.;
Submitted (AUG-1994) to the EMBL/GenBank/DDBJ databases.
-!-FUNCTION: Regulates transcription of the histone genes during the S-phase of the cell cycle by repressing transcription at other S-phase of the stages. Thought to act indirectly but precise mechanism cell cycle stages.
                                                                                                                                                                                                                                                                                                                                                        STRAIN=S288c;

The orthodenticle gene encodes a novel homeo domain protein involved
In the development of the Drosophila nervous system and ocellar visual structures.

C. -- FUNCTION: Involved in the development of the Drosophila nervous system and ocellar visual structures.

C. -- SUBCELLUTAR LOCATION: Nuclear (Probable).

C. -- DEVELOPMENTAL STAGE: Expressed in the anterior region of the embryo before cellularization and becomes localized to the procephalic head region following gastrulation.

C. -- DOMAIN: Concains multiple repeats consisting of single amino acids (e.g., Gly, Ser, His, and Asn) and pairs of amino acids (e.g., Gly-Val).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This SWISS-PROT entry is copyright. J. Exp. Med. 172:589-597(1990).
-!- FUNCTION: Developmentally regulated neuraminidase implicated in parasite invasion of cells. May contribute to the pathology during T.cruzi infection by cleaving sialic acid from cells of the immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Kahn S., van Voorhis W., Eisen H.; "The mammalian form of Trypanosoma "The major 85-kD surface antigen of the mammalian form of Trypanosoma cruzi is encoded by a large heterogeneous family of simultaneously
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -!- CATALYTIC ACTIVITY: Hydrolysis of alpha-(2->3)-, alpha-(2->6)-, alpha-(2->6)-, alpha-(2->8)-glycosidic linkages of terminal sialic residues in oligosaccharides, glycoproteins, glycolipids, colominic acid and synthetic substrates.
-!- DEVELOPMENTAL STAGE: Mammalian stage of parasite.
-!- MISCELLANBOUS: The parasite mammalian stage surface antigen exhibits extensive antigenic diversity.
-!- SIMILARITY: Belongs to family 33 of glycosyl hydrolases.
-!- SIMILARITY: Contains 2 BNR repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Eukaryota; Euglenozoa; Kinetoplastida; Trypanosomatidae; Trypanosoma.

```
-!-FUNCTION: Transcriptional corepressor that binds to a number of transcription factors. Inhibits NF-kappa-B-regulated gene expression. Inhibits the transcriptional activation mediated by FOXA2, and by CTNNB1 and TCF family members in wht signaling. The effects of full-length TLE family members may be modulated by association with dominant-negative AES.
-!- SUBNUT: Homooligomer and heterooligomer with other family members. Binds LEF1, RUNX1, FUNX3, FOXA2, UTX, UTY, histone H3, HESX1, HES1 and the NF-kappa-B subunit RELA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Dasen J.S., Martinez Barbera J.-P., Herman T.S., O'Connell S., Olson L., Ju B., Tollkuhn J., Baek S.H., Rose D.W., Rosenfeld M.G., "Temporal regulation of a paired-like homeodomain repressor/TLE corepressor complex and a related activator is required for pituitary

                              liver and muscle.

PTM: Phosphorylated, probably by CDC2. The degree of phosphorylation varies throughout the cell cycle, and is highest at the G2/M transition. Becomes hyperphosphorylated in response tell differentiation and interaction with HES1 or RUNX1. SIMILARITY: Contains 6 WD repeats.

SIMILARITY: Belongs to the WD-repeat Groucho/TLE family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (POTENTIAL).
(POTENTIAL).

The degree of phosphorylation varies throughout the cell cycle, and is highest at the G2/M transition. Becomes hyperphosphorylated in response to all differentiation and interaction with HES1 or RUNX1. SIMILARITY: Contains 6 WD repeats.
SIMILARITY: Belongs to the WD-repeat Groucho/TLE family.
                                                                                                                      M., Clevers H.;

Clathrin-associated protein complexes are believed to interact with the cytoplasmic tails of membrane proteins, leading to their selection and concentration. Binding of AP180 to clathrin triskelia induces their assembly into 60-70 nM coats.

SUBCELLUIAR LOCATION: Component of the coat surrounding the cytoplasmic face of coated vesicles in the plasma membrane.

        IsoId=Q05140-2; Sequence=VSP 000173;
-!- DOMAIN: Possesses a three domain structure: the N-terminal 300 residues harbor a clathrin binding site, an acidic middle domain 450 residues, interrupted an Ala-rich segment, and the C-terminal domain (166 residues).
-!- PTM: Phosphorylated (By similarity).
-!- SIMILARITY: Contains 1 epsin N-terminal homology (ENTH) domain.

Patients with PEO have mitochondrial myopathy, progressive external ophthalmoplegia, and other abnormalities associated with multiple different deletions of mitochondrial DNA. SIMILARITY: Belongs to the DNA polymerase type-A family.
                                                                                                                                                                                                                                                      SEQUENCE FROM N.A.
